

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P11	Policy and research. Developing good policy requires good data from a variety of sources. This can include aggregate statistics and public data from a governmental body, but also involves the analysis of microdata (eg, from surveys). [1]	Analyze diverse sources of data to study and design policies.	Policy analyst	Identify the effect of a policy			
P11							
P11							
P11	Monthly						
P11	We needed to identify the effect of a policy. While we could have conducted our own survey, we found other survey microdata that allowed us to answer the question. In our case, the survey asked specific questions that were of interest. [2]	Utilize data from existing survey to analyze a policy's effect.			Could collect own data, but chose to reuse data	Microdata from some surveys asking questions relevant to targeted policies	
P11	from a survey company that fielded the proprietary survey.						
P11	We had the company send us the questionnaire, code book, and methodology. They also provided us with a sample section from a previous year's report that they had produced. From these items, we were able to assess the questions asked and whether they met our needs. Importantly, the methodology allowed us to determine whether there was strong selection bias or non-response that could have affected our inference. We determined that the dataset met our needs, so we purchased it. [3]	The survey company shared their questionnaire, code book, methodology, and a sample section of the report they produced. Assessed questions asked to check if they met the needs. The methodology helped identify potential selection bias or non-response issues, which could affect inference.			Data provenance		Contain the desired columns, details about the methodology used, and have sample results in a meaningful way
P11	Source reputation, Metadata, Data collection conditions, Ability to access full datasets, Visualizations, Sample section from previous year's report						
P11	Yes						
P11	Yes						
P11	Yes						
P11	The questionnaire allowed us to see the exact wording of the questions being asked and the order in which items and responses were presented. From this we could clearly see that the questions would provide information we needed to inform our policy development.	Need to check the wording and order of the questions being asked.			Data collection method matters		Contain desired columns, and data collection method is sound
P11	The questionnaire, code book, and methodology allowed us to see the distribution of responses and determine whether the data appeared to be of high quality (we would not know for sure until we received the microdata). Had the questions been poorly worded, there been large amounts of missing data (indicated by the responses in the code book), or the methodology been weak or unavailable, it would have suggested to us that the data was low quality. [4]	Questionnaire: question quality, Code Book: distribution of responses, question quality, the amount of missing data, Methodology: sound or not			Distribution tells data quality; microdata ~ sample data;		Data is unbiased (no misinterpretation of the question), methodology is sound and this information is available, and missingness is minimum and available
P11	Based on the quality of the questionnaire, codebook, and methodology, we determined that the data was likely of high quality and worth the price of purchase.	Supplementary materials are of good quality			Impression		Supplementary materials are of good quality
P11	While working on another project in a previous role, we looked for other proprietary data that we could purchase. Unfortunately, the few sources we found were full of missing or incorrect data. Some information was wrong or duplicated, there was incorrect spelling, formatting was atrocious. Very few sources collect the information we were looking for, so there were few options to get usable data. [5]	Few sources collect the data. The documents were all of poor quality: missing data, the presence of duplicated and wrong information (incorrect spelling, bad formatting)		N/A		N/A	Missing data, incorrect (incorrect spelling, formatting) data, and duplicated data is minimum
P11	Proprietary vendor						
P11	We couldn't assess the quality until we had purchased the data. However, given how few sources collected the data, we had to gamble on whether the data was worth the price.	Gambled					
P11	Source reputation, Data collection conditions, Sample data						
P11	No						

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P11	No						
P11	Yes						
P11	We knew exactly what type of data we were looking for. If that data had been high quality, it would have allowed us to answer our question.	With clear objective: if data are of high quality, then could answer the research questions					Being able to use the data to find conclusive answers to the research question
P11	We had to rely on the reputation of the chosen vendor to determine whether the data would have been in good quality. There was some sample data, but not enough to determine if the full dataset would meet our needs. As the data set was proprietary, there was little we could do to verify if the full data set would meet our needs until after purchase. [6]	Need to purchase before get access. Relied on source provider's reputation. Sample data size is too small to determine if the dataset meet their needs.					Data are from reputable data provider, and there is enough sample data
P11	We were provided sample data. As we were unable to determine from the sample data if the data would meet our needs, we did not purchase it. [7]	Provided sample data was insufficient: didn't purchase			Sufficient: sufficient amount of sample data or/and data are of sufficient quality		Sufficient amount of sample data or/and data are of sufficient quality
P11	For this dataset and vendor, it would have been useful to interview other clients of the vendor. That would have allowed us to better understand the quality of that data, its weaknesses, and whether it would have allowed us to meet our goals without excessive time devoted to data cleaning. [8]	Reviews from the data providers' clients can help them to understand data quality, its weaknesses, and ability to meet goals without excessive efforts in data cleaning.					Being able to connect with others who used the dataset, and get information on data quality, weakness, and cleaning efforts required, which cannot be excessive
P14	I'm an engineer who design new features according to the usage data.	Design features according to usage data	Engineer who build data analysis tool				
P14	3 years						
P14	Data analysis tool	Data analysis tool					
P14	Multiple times per week	Multiple times per week					
P14	I was looking for datasets containing the usage events of our companies products and some other informational tables that can be joined together. Where: my companies private storages Criteria of success: whether it contains some raw data what i'm looking for	Datasets contain the usage events of their products and other information tables. Have required raw data.		Design new features for data analysis tool		Use usage events data along with other relevant and compatible data	Contain required columns
P14	companies private storages	Internal platform					
P14	By sacnning the first few records of the data + I also found that other people uses those data for similar purposes.	Need to scan first few records of the data and have access to other people's usage cases					Need to view sample data and similar usage cases
P14	Source reputation, Sample data						
P14	Yes						
P14	Yes						
P14	Didn't need to pay						
P14	Sampled data has the columns that I want	Check if contain certain columns.					Contain required columns
P14	Sampled data's some aggregated measures are reasonable.	Check if aggregated measures are reasonable.					Reasonable aggregated measures are used
P14	No needed to pay						
P14	The dataset that I found was too large to query/analyze.	Dataset is too large.		Design new features for data analysis tool		Use usage events data along with other relevant and compatible data	Data size is appropriate for the analysis
P14	Company's private storage	Internal platform					
P14	Saw many other people uses those datasets	Many other people are using the datasets.					Dataset is widely used
P14	Ability to access full datasets	Access to full dataset					Need access to full dataset

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P14	Yes						
P14	Not Sure						
P14	Didn't need to pay						
P14	After running some sampling codes, I was able to determine that this is too large to go ahead.	Run sample code and realized the size was too big					Data size is not overly large
P14	Cannot determine its quality since i was not able to access it really well.	Cannot determine quality due to the size.					
P14	no needed to pay						
P14							
P8	As a Data Scientist in the food industry, my work revolves around leveraging internal databases and public datasets to drive innovation and efficiency. My focus areas include data analysis for business intelligence, predictive modeling, product development, and market research. Some key projects involve: Demand Forecasting: Developing models to accurately predict product demand, optimizing our supply chain and ensuring customer satisfaction. Production Process Optimization: Utilizing time series analysis to improve production methods and product quality. Market Trend Analysis: Creating an automated system that provides succinct, actionable insights into market trends through advanced web scraping and summarization techniques.	Data Scientist in the food industry. Get data from both internal and external databases. Data analysis for business intelligence, predictive modeling, product development, and market research. Predict product demand to adjust supply. Improve production method and quality. Analyze market trends.	Data scientist in the food industry				
P8							
P8							
P8							
P8	In a recent demand forecasting project within our sector, we aimed to enhance our predictive accuracy by integrating broader market data. We identified a critical resource in NielsenIQ's dataset, which provided detailed sales data on our competitors. This external dataset was pivotal in offering insights beyond our internal metrics, enabling a comprehensive market analysis. After standardizing the NielsenIQ data to match our internal formats, we used advanced analytics to incorporate market dynamics into our forecasting models. This enriched analysis led to improved forecasting accuracy, informed our inventory strategies, and identified competitive positioning opportunities.	To improve demand forecasting accuracy with more external data. Identified data on NielsenIQ's, which is from their competitors.		Improve demand forecast model accuracy		Sales data on competitors	
P8	NielsenIQ						
P8	To assess the potential value of the NielsenIQ dataset, we first considered its alignment with our specific needs for enhancing demand forecasting within our industry. We evaluated the dataset's coverage, specifically looking for comprehensive sales data on competitors that could fill gaps in our market understanding. Additionally, we conducted a cost-benefit analysis to weigh the dataset's cost against the expected benefits, such as improved forecasting accuracy, better strategic positioning, and potential for increased market share. This evaluation involved consulting with our analytics team to estimate the potential impact on our forecasting models and decision-making processes, ensuring that the investment in the dataset would provide actionable insights and a significant return on investment.	Need to align with the task, which is enhancing demand forecasting. Data coverage need to be comprehensive. Cost-benefit analysis with analytics team: weight cost against benefit on improvement on forecast accuracy, strategic positioning, and market share.					Need to align with the task, data coverage is comprehensive, and the cost is cost-effective
P8	Source reputation, Metadata, Data collection conditions, Prevalence of missing data, Sample data, Visualizations	Source reputation, Metadata, Data collection conditions, Prevalence of missing data, Sample data, Visualizations					
P8	Yes						

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P8	Not Sure						
P8	Not Sure						
P8	The provided information was deemed adequate for several reasons: 1. Source Reputation: The credibility of NielsenIQ as a reputable data provider assured us of the dataset's reliability. 2. Metadata: Detailed metadata confirmed the dataset's relevance and scope matched our project needs. 3. Data Collection Conditions: Insights into the dataset's creation process ensured its applicability to our forecasting models. 4. Sample Data: Preliminary examination through sample data affirmed the dataset's integration potential with our systems. Overall, these points made us confident the dataset was up to the task.	Data provider should be reputable, which indicates the dataset's reliability. Need metadata to check if relevance and scope match needs. Data creation process ensure its applicability to the model. Sample data suggest integration potential					Data provider should be reputable, information on relevance and scope is available and matches the task, data creation process is available and sound, sample data is available and suggest integration potential
P8	The provided information was helpful but left me uncertain about the dataset's quality due to two main issues: 1. Missing Data: The heads-up on missing data was useful, but it raised concerns about how these gaps might affect our analysis. 2. Geographic Coverage: The lack of clear info on whether the dataset covers all our needed geographic locations added to this uncertainty.	Uncertain about data quality. Provide information about missing data, but it raises such concerns. Lack of geographic coverage (not provided) leaves uncertainty about whether the needed locations are covered.					Information on missingness is available and minimum, and details on some essential aspects of data collection conditions or data range
P8	Without comprehensive insights into these critical areas, conducting a precise cost-benefit analysis becomes challenging. This makes me unsure if the investment would guarantee the expected return, especially in meeting our specific geographic and data completeness criteria.	Lack of insights into geographic coverage completeness of the full dataset leaves cost-benefit analysis unclear.					Information on missingness is available and minimum, and details on some essential aspects of data collection conditions or data range
P8	Our objective was to identify emerging food trends and shifting consumer preferences to inform the development of new products in the food processing industry. To achieve this, we sought to analyze diverse datasets encompassing consumer feedback and market analysis reports. We sourced datasets mainly from NielsenIQ. Despite the potential these datasets appeared to offer, they ultimately fell short of providing the actionable insights needed for our new product development project. The lack of timely, relevant, and specific data led to inconclusive results, making it challenging to pinpoint emerging food trends accurately.	Identify emerging food trends and shifting consumer preferences. Analyze consumer feedback and market analysis reports. Lacking actionable insights, timely, relevant and specific data lead to inconclusive results		Understand emerging food trends and shifting consumer preferences to inform the development of new products in the food processing industry		Data on consumer feedback and market analysis reports	Timely, relevant and specific data
P8	NielsenIQ						
P8	Here's how we assess the potential value of the datasets: 1. Project Relevance: Checked if data topics matched our goals of capturing consumer habits and food trends. 2. Quality & Completeness: Looked for recent, reliable data with minimal missing information to ensure accuracy. 3. Geographic Relevance: Prioritized datasets with detailed location data matching our target markets for localized insights. 4. Sample Review: Examined sample data for compatibility with our systems and ease of analysis. 5. Stakeholder Input: Consulted with product teams and analysts to confirm the dataset's utility and applicability.	Relevant to the goal of this project: capturing consumer habits and food trends. Minimal missing information. Detailed location information that match targeted area. Check sample data's compatibility. Consult product teams and analysts to confirm dataset's utility and applicability.					Need to be relevant to goal, include information on location, contain minimal missing data, sample data is available and compatible to the system, dataset is of good utility and applicability

P21	Yes						
P21	Yes						
P21	Yes						
P21	The provided information was adequate in assessing whether the dataset could fulfill our intended purpose. We evaluated the dataset based on its relevance to our predictive modeling needs, such as startup funding rounds, market trends, and industry-specific metrics. The metadata completeness and sample data helped us determine if the dataset aligned with the parameters required for our data-driven tasks.	Relevance to the predictive model. Metadata completeness and sample data suggest the required columns are available.					Relevant to the task, metadata is complete, metadata and sample data suggest the required columns are available.
P21	Assessment of Data Quality: The provided information sufficiently allowed us to gauge whether the data was of usable quality. We considered factors such as the data collection conditions, prevalence of missing data, and the ability to access full datasets. The metadata completeness and sample data provided insights into the data's structure and accuracy, ensuring it met our quality standards for analysis.	Base on information about data collection conditions, missingness, access to full data. metadata completeness and sample data: data's structure and accuracy					Contain information about data collection conditions, missingness, access to full data. metadata completeness and sample data: data's structure and accuracy

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P21	Assessment of Data Worth Paying for Access:The provided information helped us assess if the data was worth paying some price to access. Factors such as source reputation, metadata completeness, and the ability to access full datasets influenced our decision. However, additional insights into the data collection methodology and data validation processes would have further justified any potential costs associated with accessing the dataset.	Rase on information about source reputation, metadata completeness, and access full dataset, data collection method, and data validation process					Contain information about source reputation, metadata completeness, and access full dataset, data collection method, and data validation process
P21	I encountered an instance where the datasets I found could not contribute to a data-driven task effectively. We were aiming to analyze customer sentiment and preferences for our startup growth platform, CChub, to optimize our marketing strategies. However, the datasets we obtained lacked sufficient granularity and real-time updates, hindering our ability to derive actionable insights.	Analyze customers sentiment and preferences for a startup growth platform to optimize marketing strategies. Lack granularity and real-time updates.		Analyze customers sentiment and preferences for a startup growth platform to optimize marketing strategies			With sufficient granularity. Real-time updates.
P21	The new datasets were sourced from a third-party data provider specializing in customer behavior analytics.	3-rd party data provider specialize in customer behavior analytics					
P21	We assessed the potential value of the datasets based on their relevance to our analysis goals, data freshness, and coverage of key metrics like customer feedback and engagement patterns.	Base on relevance to analysis goals, data freshness, and coverage of key metrics.					Relevant to analysis goals, data is fresh, and cover key metrics
P21	Metadata, Data collection conditions						
P21	No						
P21	No						
P21	No						
P21	The dataset's ability to fulfill our intended purpose due to limited insights into specific metrics and real-time data availability.	Limited insights into specific metrics and real-time availability					Information about columns is comprehensive and data is up-to-date
P21	The data's quality as it lacked details on data validation processes and data integrity checks.	Lack details on data validation processes and data integrity checks					Information on data validation processes and data integrity checks
P21	The data's worth paying for access as it did not adequately showcase the dataset's value proposition and potential impact on our analysis.	Lack data's value proposition and potential impact					Information on dataset's value proposition and potential impact
P21	Additional information that would enhance our ability to assess the potential value of datasets effectively includes detailed documentation on data sources, validation processes, data freshness, and real-time update frequencies. This would ensure that the datasets align with our analysis goals and provide actionable insights for our data-driven tasks.	Want dcumentation on data sources, validation processes, data freshness, and real-time update frequencies.					Documentation on data sources, validation processes, data freshness, and real-time update frequencies.
P20	As the CFO of <redacted organization>, I require access to data sources related to financial performance, market trends in the real estate industry, customer demographics, and operational metrics. I use this data for financial analysis, forecasting, budgeting, investment decisions, and overall strategic planning to ensure the financial health and growth of Parkwell.	CFO of <redacted organization>, financial performance, market trends in real estate, customer demographics, operational metrics. Financial analysis, forecasting, budgeting, investment decisions. and overall strategic planning	CFO				
P20	I have extensive experience working with data, particularly financial data, and analyzing it to derive actionable insights. My background includes financial modeling, budget management, cost analysis, risk assessment, and investment evaluation.	extensive experiences, background with financial modeling, budget management, cost analysis, risk assessment, and investment evaluation					
P20	work in the real estate and property management industry, specifically focusing on leveraging data-driven strategies to optimize financial outcomes and enhance customer experiences.	real estate and property management industry					
P20	Monthly						

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P20	We were working on enhancing our AI-powered platform's capabilities to match tenants with their perfect homes more effectively. To achieve this, we needed access to a comprehensive dataset containing detailed information about available rental properties in major cities across Nigeria.	Goal: enhance AI platform's ability to match tenants with homes. Need access to dataset contain info about available rental properties in major cities		Improve an AI platform's capability to match tenants with homes		Dataset that contains detailed information about available rental properties in major cities across Nigeria	
P20	We obtained the new dataset from a reliable real estate data provider that specializes in collecting and aggregating property listings from various sources, including real estate agencies, landlords, and property management companies.	From a reliable real estate data provider who collect data from sources such as real estate agencies, landlords, and property management companies					
P20	We assessed the potential value of the dataset based on several factors:Source Reputation: The data provider had a strong reputation in the real estate industry for providing accurate and up-to-date information.Metadata: The dataset included metadata such as property types, sizes, locations, amenities, rental prices, and availability status, which were crucial for our matching algorithm.Data Collection Conditions: We ensured that the data collection process adhered to industry standards and legal requirements to maintain data integrity.Ability to Access Full Datasets: We confirmed that the dataset provided comprehensive coverage of rental properties in our target cities without significant gaps or missing data.Sample Data and Visualizations: The data provider offered sample data and visualizations that allowed us to preview the dataset's structure and quality before making a decision.	Strong reputation for providing up-to-date and accurate info, detailed metadata, collection process adhere to industry standards and legal require, comprehensive coverage of properties in target cities without much missingness, and sample data and visualizations are helpful to see structure and quality					Strong reputation for providing up-to-date and accurate info, detailed metadata, collection process adhere to industry standards and legal require, comprehensive coverage of properties in target cities without much missingness, and sample data and visualizations are helpful to see structure and quality
P20	Source reputation, User reviews, Metadata, Data collection conditions, Sample data, Visualizations	Source reputation, User reviews, Metadata, Data collection conditions, Sample data, Visualizations

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P33	Recently, I was looking up something about a US Census Data resource and I quite accidentally stumbled across a dataset that we were also looking for. The dataset that we were looking for, although I'm not sure if the search had really begun was data about the number of Citizen Age Voters of different races at different geographic levels (e.g., county, tract, etc.) across time. I'm not sure if our team had not conducted a thorough search initially, but these were data we needed access too and I had been told they weren't available or easily accessible. The data driven task that we were trying to achieve was to show disparities in polling places accessibility in terms of the number of voters each polling location, or aggregation of polling locations served. Race indicators are important to our analysis because we were interested if polling accessibility differed by race. For example, in predominantly Black counties does access to polling locations differ substantially? The Census Bureau ended up having the data I was looking for, but I was looking for Number of people of voting age and who are citizens for each county during each election year and then broken down by race.	Accidentally find relevant US Census Data resource, not sure if that's the original goal nor the team has conducted a thorough search before this. Difference (in # of voters, # of citizens, races) in polling location accessibility.		Show disparities in polling places accessibility in terms of the number of voters each polling location, or aggregation of polling locations served		Data about the number of Citizen Age Voters of different races at different geographic levels	
P33	The United States Census Bureau						
P33	I downloaded the data file, the one I thought could be relevant and opened it. I think looked to see which columns and years existed in the data. With this data this assessment is fairly simple, with other data this can be a fairly complex task. For example, we also work with polling location data, and these data are messy. There are duplicate locations, there are missing values where we need there to be values. Sometimes the aggregate number of rows doesn't make sense year-over-year.	Check data contain what columns and years. For other datasets, such assessment is hard: duplicate locations, missing key values , # of row incorrect					Contain certain columns, some contextual information, unusable and missing data are minimal
P33	Source reputation, Metadata, Ability to access full datasets

P33	No						
P33	Normally in provided information there is a summary about the data. You're lucky if you get a data dictionary to go along with that. But it's unlikely that someone has tabulated the level of missingness for all the columns which is often essential for having a robust analysis.	Summary about data, if contain data dictionary, missingness in each column					Summary about data, if contain data dictionary, missingness in each column
P33	Normally inadequate. It can be challenging to anticipate data quality issues before you actually start working with the data. Because others may have very different intended use cases, a dataset with quality issues may still serve their purpose and not yours. It's often very case specific.	Hard to predict data quality issue before working with it. Should be case-specific: others have different cases, even with issues may serve their purpose					Need to explore the full data
P33	I would pay for a resource if I had access to the sample data and could actually use and look and look at the sample. Additionally, if similar organizations had recommended the data or were using it for a similar means.	Can use and look at the sample data. Other entities recommend the data. Others use it for similar purpose					Sample data is available, other entities recommend or use it for similar purpose

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
	We then asked a similar question to the scenario outlined in the last Positive Experience question, but this time by age. The Census Bureau has some age-specific data, but because it is aggregated into the Census Bureau's age bins (e.g., 10 - 17, 18 - 25) these data were less accessible to our use. The age aggregations are limiting in some cases because citizens are allowed to start voting at the age of 16, so 16 and 17 year-olds are omitted from the analysis because of how the data are structured. The age bin below contains a large number of children who would not be of voting age. So because of the way the Census has designed their aggregations, it makes it challenging to do voting age analysis for youth voters. Another data source that we were looking for was voting turnout. Turnout that is broken down by county and census tract, by race, and by age.						
P33		Similar question by age. Age aggregation limits analysis		Show disparities in polling places accessibility in terms of the number of voters each age group		Data about the number of Citizen Age Voters of different ages at different geographic levels

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P28	I FOIA-d all fifty states, and a few cities, for data on their rape kit backlog for my data investigation. I was trying to give my audience a sense of how many rape kits were left untested in crime labs and law enforcement agencies across the country, in 2022. My criteria for success was getting data from as many states as possible -- because then local news outlets would be able to report on the problem -- and to be able to visualize and explain the data (its limitations are a big part of this), the implications of a rape kit backlog, etc. in a way that is compelling to an audience that might not even know what a rape kit is.	get rape kit backlog data from as many states as possible: visualize, explain and report on the problem		Visualize, explain and report on how many rape kits were left untested in crime labs and law enforcement agencies across the country		rape kit backlog data	data covers various regions
P28	You can read my work here: <redacted link>						
P28	I FOIA-d crime labs, state attorney general's offices, and law enforcement agencies.	I FOIA-d crime labs, state attorney general's offices, and law enforcement agencies.					
P28	If, from the pdfs and spreadsheets I was sent, or the reports I found online, I could determine the number of rape kits that were left untested in law enforcement agencies and crime labs in each state at the end of 2022, I used the data. Also under consideration was how well I could explain the limitations of the data (ex: this number excludes these jurisdictions, data from these years, etc.)	if can determine the number of rape kits were left untested (achieve task), and if can explain the limitations of the data					achieve task, information about limitations of the data
P28	Data collection conditions, Prevalence of missing data, Ability to access full datasets, Ability to speak to someone involved in the data collection process						
P28	Yes						
P28	Yes						
P28	No						
P28	My answers for the next three questions all kind of merged into one answer, so here it is: The data on the national rape kit backlog was already so bad to begin with that I did feel that whatever data I was able to obtain would be of value. Of course, my final investigation is riddled with footnotes -- few of the datasets I obtained through FOIA included data for all of the years I was looking for, for all of the crime labs/law enforcement agencies in the state, etc. So the standard of the quality of the data was low, but I used as much of the data as I obtained because I felt like I could sufficiently explain the limitations of each dataset. Data collection conditions -- knowing whether a crime lab had their license taken away during years of testing due to fraud, or whether a state changed its laws so the data reporting requirements changed, (both situations I encountered) etc. -- very useful for knowing whether the dataset can fulfill my intended purpose. Often knowing the data collection conditions hinged on whether I was able to locate/speak to someone in a lab or state agency who was willing to take the time to explain to me when these situations applied. Prevalence of missing data -- not prevalence, but extent. Knowing which years or for which counties/cities, etc. data was excluded was very useful. Ability to access full datasets -- again this was almost never the case in this area (as is the case with crime data in general) so it's not something I expected of any state or law enforcement agency.	data on national rape kit backlog is bad, additional data would always be valuable, coverage is limited (year, law enforcement agencies), used all data because being able to explain the limitations,					data collection conditions-licenses changed,
P28	See above.

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria	
P27	I was working on a project about how lack of access to child care hinders working parents, particularly women, from reaching their full economic potential. This project was part of a collaboration between the AP and many different newspapers across the country, involving dozens of different journalists. My editor asked me to find data that could be relevant for the series. I looked through many different sources and considered different datasets, and in the end decided to analyze IPUMS CPS data on maternal employment rates plus data from the Census Household Pulse on child care disruptions. My criteria for success is that I wanted datasets that would give me interesting and novel insights that would make for a compelling story. My co-author on the article specifically said that she wanted some kind of big number or attention-grabbing finding that would stand out in the headline or the introduction of the story. At the same time, I wanted the datasets to be from a credible source, not just some random market research survey. Also, I wanted data that could be easily localized. Since this was a large collaboration, I was tasked with writing a guide for journalists about they could use data about their own particular city/state to write a local story. Here is the story that was ultimately published: https://apnews.com/article/daycare-child-care-college-degree-moms-ac72f1227844eae0281305835e07273b	lack of access to child care hinders women from reaching econ potential, find data that relevant to this topic, data gives interesting and novel insights and compelling story, big number or attention-grabbing finding for standing out in the headline or intro, from a credible source, easily localized		Give interesting and novel insights and compelling story about how limited access to child care prevents working parents, especially women, from achieving their full economic potential.		data related to lack of access to child care hinders women from reaching econ potential

P27	Since both datasets come from the Census, I consider them to be dependable sources, and they are both available for free. As a journalist, I rely largely on public data sets. The only time I ever pay for data is if I have to pay a fee for a public records request, but even then it's rare I have to pay anything. I sought out IPUMS specifically because I saw a Washington Post article about women's employment rates which mentioned a study by the Penn Wharton Budget Model. I looked up the original study (https://budgetmodel.wharton.upenn.edu/issues/2023/11/27/explaining-prime-age-womens-employment) and saw that they used IPUMS data, so I decided to do the same. That way I was able to check my calculations against theirs, and since I got the same results, I knew that my methodology was sound. (The difference between their analysis and mine is that I took it further, also looking at employment rates by state and metropolitan level and race.) For the Household Pulse, I had worked with that data for earlier stories, and I wanted a way to connect the finding on employment with findings on child care disruptions.	reliable data provider (from the Census), free access (rarely pay for datasets), read about a relevant study and used the data they used, make more in-depth analysis, check calculation by comparing to theirs,					reliable data provider (from the Census), free access (rarely pay for datasets), read about a relevant study and used the data they used, make more in-depth analysis, check calculation by comparing to theirs,

P25	It was a digital elevation model (DEM) from ALOS PALSAR that I thought we could use to improve the elevation layer in our routing algorithm, so that we're making better recommendations for walk paths (i.e., not overestimating where hilly or slope parts are and not recommending people to walk the route). However it did not work out as the data was too large and it'd take too much time for us to simplify it for our use.	DEM to improve routing alg: recommend for walk paths-but too large, take too much time to simplify		Improve routing algorithm to make better recommendation for walk paths		an digital elevation model (DEM) from ALOS PALSAR to improve the elevation layer in our routing algorithm	data size too large, compatible
P25	ALOS PALSAR - https://www.eorc.jaxa.jp/ALOS/en/index_e.htm						
P25	the data was under NASA EarthData, so having not much domain knowledge in elevation layers I implicitly trusted the authoritative source.	trust the source/data provider					trust the source/data provider
P25	Source reputation, User reviews						
P25	Not Sure						
P25	Not Sure						
P25	No						
P25	the data had a lot of parameters, so I wasn't sure how it might fit into our routing algorithm as this would be the purview of the routing engineer team.	too many parameters					compatible to existing algorithms, number of parameters
P25	The data had lots of jargon, so I wasn't able to really assess the quality.	jargon (confusing column names)					confusing column names
P25	As mentioned I think the issue lies with my lack of domain knowledge in it, so I wasn't sure if it'd have been useful for our algorithm and hence I could not ascertain if it was worth paying for it.	confusing column names					confusing column names
P25	Data dictionary giving more context of the data (instead I had to play around with the visualisations to understand what different variables did), and also linked examples to actual projects on how they are used.	data dictionary giving contexts (usage example & schema)					data dictionary giving contexts (usage example & schema), play around with the visualisations to understand what different variables did
P24	I'm a newsroom developer which means that I often work with government or research datasets that I then turn into visualizations for the news. The end result is almost always a reader-facing visualization product or application.	government/research datasets to vis	newsroom developer				
P24	4 years						
P24	News and media						
P24	Multiple times per week						
P24	The most recent example is a simple one, but it's the data that I found from the USA National Phenology Network of spring arrival throughout the country, which is judged based on the blooming of certain species of flower. My goal was to regionalize it for the region that I work in, and show the data that would most concern our local residents. The questions we were looking to answer were, "When did spring arrive for my area this year?" and "How does this year compare to previous years?" and "How does my area compare to the rest of the country?" Using the GeoTiff provided by the network, we were able to create our own maps that answered those questions.	spring arrival throughout the country		To create maps to show spring arrival related questions in local area		data of spring arrival throughout the country	
P24	The USA National Phenology Network's data request website						
P24	There were some visualization examples on the landing page that gave an idea of what to expect from the data. But there was no way to truly know until I downloaded it and started playing around with the data in QGIS.	vis examples suggest what to expect from, cannot know until download and play with the data					vis examples suggest what to expect from, cannot know until download and play with the data
P24	Source reputation, Metadata, Ability to access full datasets, Visualizations

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P3	Having worked on language models, I regularly need to find datasets for tasks that are tailored to my application. Usually, the dataset is used for the supervised training of models, or the evaluation of them as well. To do so, I have a few different strategies: Automated Searches: I developed an internal tool for Slack that allows me to search using natural language. This tool helps me find datasets by understanding my specific needs and finding relevant research papers that include links to their datasets. In addition, they disclose information such as dataset structure and content. Looking Through Conference Papers: I checked out papers from major conferences in language processing and linguistics. These papers often introduce new datasets and are a great source of high-quality data. Exploring Online Repositories: I also explored online platforms that collect datasets for language tasks, such as the Linguistic Data Consortium or Hugging Face's dataset library. These sites have a wide variety of datasets ready to use. Usually, I'll use the noted automated tool to accelerate my process of exploring new datasets, with requirements I'm searching for. My largest concern is with discovery, and usually the time required to search for them.	llm: find datasets tailored for supervised training of models or the eval. 1. auto search: internal tool for slack to search with nl, understand my needs and find relevant papers, accompanied datasets and the structure and content. 2. conference papers: introduce new datasets that are high-quality 3. online repo: platforms collect data for language tasks, linguistic data consortium or hugging face. usually go for 1, because of time		Conduct supervised training and evaluation of language models		find datasets tailored for supervised training of models or the eval	
P3	Hosted on GitHub.	github					
P3	1. Content - Does it contain the required details and content I'm looking for. 2. Quality - Is the quality of the data up to par. Usually, once a dataset is discovered, investigating it requires little to no incentive.	required content and details & quality, once discovered, then investigate it					required content and details & quality, once discovered, then investigate it
P3	Source reputation, Ability to access full datasets, Sample data, Visualizations						
P3	Yes						
P3	Yes						
P3	Didn't need to pay						
P3	Source Reputation - Roughly indicative of the quality of data. Usually is peer-reviewed. Access: Need to access dataset, to use it. Therefore, it's a requirement. Sample Data: Quick representation of the type of data I'm looking for. Visualizations: Depends on the kind of visualization. If certain metrics such as IAA are easily viewable, then I would appreciate it.	source repu: indicate quality, peer-reviews, need to access, sample is a quick representation, vis: some tricks like iaa are viewable					source repu: indicate quality, peer-reviews, need to access, sample is a quick representation, vis: some tricks like iaa are viewable
P3	Source Reputation is usually indicative of this. However, standard scores such as IAA can reaffirm the assumption.	source repu & standard score like iaa					source repu & standard score like iaa
P3	There is so much data available. It's usually not worthwhile. If it was a niche dataset that I have to pay for, I would question if I should just create my own data.	unlikely to pay: many available, if niche, could create their own					unlikely to pay: many available, if niche, could create their own

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P3	In one particular instance, my goal was to enhance the accuracy of a machine learning model designed to predict consumer behavior in emerging markets, specifically focusing on online shopping patterns. The task required granular, up-to-date datasets reflecting consumer interactions, preferences, and trends across different online platforms within these markets. I employed a similar strategy as before, combining automated tools for scanning through academic papers and datasets, and manual exploration of dataset repositories and conference proceedings. My focus was on finding datasets that included: E-commerce transactions and user behavior data in emerging markets. Social media analytics related to shopping patterns. Demographic and psychographic profiles of online shoppers. Despite a comprehensive search, the datasets I discovered faced several limitations that rendered them unsuitable for the task at hand: Outdated Information: Many of the datasets were outdated, reflecting consumer behavior from several years ago, which is not representative of current trends due to the rapid evolution of online shopping habits. Lack of Specificity to Emerging Markets: I found numerous datasets on consumer behavior, but they predominantly focused on established markets with very few insights into emerging markets. This lack of specificity made it challenging to derive meaningful insights for the target demographic. Data Privacy and Ethics Concerns: A few promising datasets raised concerns regarding data privacy and ethical use, lacking clear consent from users for the use of their data in such analyses.	enhance ml to predict consumer behavior in emerging markets, granular, up-to-date data reflect consumer interactions, preferences, and trends across platforms within the market, similar strategy, combine auto tool, and manual explore: find data that include e-commer transactions and user behavior data, social media analytics related to shopping patterns, demographic and psychographic profiles of online shoppers, but several limitations: outdated info, consumer behavior several years, not represent current trends due to evolution of online shopping habits, focused on established markets but lack insights into emerging markets, ethical use: lack clear user consent		Enhance the accuracy of a machine learning model designed to predict consumer behavior in emerging markets, specifically focusing on online shopping patterns		data that include e-commer transactions and user behavior data, social media analytics related to shopping patterns, demographic and psychographic profiles of online shoppers,	up-to-date information, insights into emerging markets, ethical use: lack clear user consent
P3	NA - Could not find new dataset. Had to create own dataset.	create own

P2							
P2							
P2	For my data management coursework project, I need to find datasets containing the poverty rate and other demographic data in New York City, the City of Los Angeles, and Chicago at the neighborhood/community level. The challenge is most official datasets released by local governments with my data of interest are at the census tract level or at the zip code level. So the level of analysis does not match. It took me some time to finally obtain, both by downloading and scraping websites, to successfully get datasets from reliable sources.	poverty rate and other demographic data in NYC, LA, and chicago at community level. most datasets are at zip code level, download, scraping websites, and get data from reliable sources		N/A		datasets containing the poverty rate and other demographic data in New York City, the City of Los Angeles, and Chicago at the neighborhood/community leve	granularity doesn't match, searching those from reliable sources takes time
P2	NY, LA, and Chicago's local open data platforms; state-level think tank (e.g. Illinois Policy); national-level think tank (e.g. Economic Innovation Group); open-source data websites (e.g. City-Data) updated by volunteers annually	NY, LA, and Chicago's local open data platforms, state-level think tank (e.g. Illinois Policy), national-level think tank (e.g. Economic Innovation Group), open-source data websites (e.g. City-Data) updated by volunteers annually					
P2	The deciding factors for me is the data source and whether there is a clear rules for data wrangling if I am looking for a processed dataset. For example, one of the reliable sources for U.S. poverty rates is U.S. National Census Bureau. But their data system is not the most intuitive for obtaining data. So when looking for a processed dataset, I checked the data source and whether they specified somewhere in the dataset/visualization about how they processed the original data. A great example would be this map showcasing poverty by city and community in LA county: https://www.arcgis.com/apps/dashboards/7846c3c37dff4728923609a9f5f849c. On the data disclaimer section (bottom left), they specify a reliable source for data and their data processing rules for calculating the poverty rate of each neighborhood in LA county. The combination of the two pieces information is essential for me to evaluate whether a dataset is worthwhile to download and work with. Another important factor is, even though the map maker did not upload the processed dataset, the website is open for scraping, making obtaining the poverty rate data possible.	data source and rules for data wrangling US census: system not intuitive, processed dataset: check source and if they specify how they processed the data (gave a good example), website open for scraping					data source and rules for data wrangling US census: system not intuitive, processed dataset: check source and if they specify how they processed the data (gave a good example), website open for scraping

P35	I am a CS Ph.D. student and one of my research areas is measurement. My current project involves collection and analysis of system-level logs for security research. In very recent past, I've worked in Internet measurement, where I studied the reliability of the Internet in regions around the world. I have also studied the security landscape on the Internet from the big vantage point of a large chunk of unused (but routed) IPv4 address space.		CS Ph.D	collect and analyze system-level logs for security research, study security lanscape on the Internet			
P35	About 3 years						
P35	Education (i work as a graduate research assistant)						
P35	Multiple times per week						
P35	For my Internet measurement research, I was looking for IP-geolocation dataset and I found a dataset, called MaxMind, which I eventually used. MaxMind provides a free version as well as a paid version of the data. Free version is less precise and less complete than the paid version. Trying to achieve: I was trying to use this dataset for my research. IP-geolocation is crucial for projects that involve measuring reliability of the Internet at various geolocation and different geographical granularities like country-level, state, city and county levels. Criteria for success: whether the dataset provider has the description about the following points (a) documentation about the schema of the dataset (b) how easy it is to use it - if I can download some version of it easily (and without paying) and if there are scripts/libraries for parsing and using the dataset - After downloading, I also want to parse it/play with it quickly and have some output. While doing this, I also keep an eye on how popular this dataset and its parsing tools, are on the Internet - I google the errors that I get while playing around and check how many people have interacted with the error/similar errors in forums like stack overflow, etc. (c) when was it last updated (IP-geolocation data is time-sensitive and it changes with time) (d) notes about the completeness/accuracy of the dataset - for e.g. comparison of accuracy of free vs. paid version (e) If it is under any license that would allow me to share the results produced by using this dataset			Measure reliability of the internet at various geolocation at different granularities	IP-geolocation data	schema documentation, ease of use (e.g. is there script for parsing/using the data?), popularity, update time, notes about completeness/accuracy, license	
P35	I downloaded from the official website of the data provider (maxmind - https://dev.maxmind.com/geoip/geoip2-free-geolocation-data#ip-geolocation-accuracy)						

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P35	I followed the following criteria to assess the potential value of the dataset: (a) the reputation of this dataset in the research community and whether any previously published papers have used it (b) if by reading the description of the schema, I could see the presence of data that I need (c) how rigorous are the documentations provided by the data provider (d) looking at how well-maintained and complete their website looks (e) if there is a license						dataset reputation in the research community, documentation rigor,
P35	Source reputation, User reviews, Metadata, Ability to access full datasets, My use case - I did not had to have very precise geolocation accuracy for my project.						
P35	Yes						
P35	No						
P35	Yes						
P35	Here is how each of the provided information influenced my decision: Metadata - - provides last updated, - data in csv format (easier to parse) Source reputation- - good enough (used in papers like - On the Accuracy of Country-Level IP Geolocation) User reviews - mostly by word of mouth from people in my research group/collaborators who have used this data in the past, hinted that this would be good enough for my use case. Ability to access full datasets - I can easily download the dataset. One of the formats that this dataset was available in, is csv, which is easier to parse and use. (Other) My use case - I did not had to have very precise geolocation accuracy for my project. Sample data - is not available and also I think in this particular case, sample data would not help much either, i think. Visualizations - there wasn't any visualization.						downloading format
P35	The data collection methodology is not disclosed - this limited my ability to judge if the quality is sufficient. Also in general, it is difficult to evaluate the quality of IP-geolocation datasets.						

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P35	source reputation - from published papers as well as from user reviews (my research group and collaborators) - which has some results about the accuracy of the dataset, i knew it would be sufficient for my use-case. there is also a reputation (as well as user review) of another "better" IP-geolocation dataset in the community, namely NetAcuity, which is a paid dataset (i.e. there is no free version of this dataset). NetAcuity discloses their data collection methodology, and they also claim to be more accurate, which makes me more confident to purchase their paid version of data, in case I would need the paid version. My use case - importantly, for my use case, I did not need the most precise IP geolocation data.						data collection methodology
P35	This was an instance during another research (different from the one that I described in the positive experience), where the goal was to evaluate the quality (for e.g. how realistic are these datasets) of some well-known and commonly-used datasets for investigation and detection of Advanced and Persistent Threats (APT) attacks. My unsuccessful experience was with one of the datasets - DARPA TC5 (transparent computing 5), which is open-sourced by DARPA. Trying to achieve: I was trying to download the commonly used datasets in order to analyze them. Challenges: - Lack of good documentation on how to parse the data - the documentation available does helps somewhat but does not help me completely parse the dataset. - Not well maintained - the documentation about the data is old and outdated - Tools to visualize this dataset don't work as intended by the authors - looks outdated and also the tools lack documentation as well - very hard to find any help - it is not clear who were the authors of this data and it was not possible to reach out to them for any help - recent github issues are not addressed by anyone - Other researchers who have used in their works are also hard to reach out to/not super helpful			Evaluate the quality of some datasets X commonly used for the investigation and detection of security attacks		the specific datasets matching their tasks	documentation up-to-date, possible to reach data source, recent github issues addressed, possible to reach other users, visualize tools
P35	it is hosted by another organization Five Directions Inc. on their Google drive, so downloaded from there.						
P35	(a) Reputation and it's use in research community - some recent papers talk about using this dataset in their work for detection of APT attacks. (b) Freely available - this is one of the few datasets for APT detection that is freely available for research. Usually other similar datasets are owned by companies and are private. (c) Metadata: I checked the number of files and data file sizes in google drive - this dataset seems more comprehensive than other similar datasets - there are more number of files in this dataset and file sizes are larger compared to other similar datasets. The schema of the data is also available.						reputation, freely available, data comprehensiveness, schema
P35	Source reputation, User reviews, Metadata, Data collection conditions, Ability to access full datasets						user reviews, ability to access full datasets
P35	Yes						

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P35	No						
P35	Didn't need to pay						
P35	- source reputation - DARPA is a government organization with a long history of supporting research and in this case, they mention that their aim is to stimulate research in APT investigation and detection. - user reviews - some research papers mention the use of this dataset - metadata - the data source provides lots of metadata and tools (but unfortunately they are outdated) - data collection conditions - the data provides describe their process of creating this dataset - ability to access full datasets - full dataset is available for downloading for free						
P35	It is very hard to tell - in fact, this was my research problem: "evaluation of quality of datasets used for APT detection". Having said that, just based on the description of the dataset, it looks like it might be okay.						
P35	This data is made open source by their providers and is freely available to everyone.						
P35	To assess the potential value of the dataset - maybe some other metadata could be useful like how many downloads - downloads in recent past, downloads per day, total downloads. of the dataset are made. Additionally, if there could be a page on data provider's website where users could write whether they were successful/unsuccessful in using the data, that would be useful. Slightly confusing in the survey - based on the questions, i wasn't sure if i should name the dataset in my responses or if i should keep them anonymous.						download information, user review

P39	I was trying to model methamphetamine use behavior in the U.S. I didn't have any hard criteria for my search given the limited availability of such datasets, but the goal was to gather information to around the population who use methamphetamine, demographics, physical and mental health characteristics, methamphetamine use pattern, utilization of the healthcare system etc. In this case, I was searching not only for datasets but also among literatures which might have reported relevant pieces of data.	Model methamphetamine use behavior in the US. No hard criteria because knowing the options is limited. Gather data about population who use methamphetamine, demographics, physical and mental health characteristics, methamphetamine use pattern, utilization of the healthcare system. Searched for both datasets and literatures reporting on such data.		Model methamphetamine use behavior in the US		Data about population who use methamphetamine, demographics, physical and mental health characteristics, methamphetamine use pattern, utilization of the healthcare system.	
P39	From U.S. Substance Abuse and Mental Health Services Administration (SAMHSA), the dataset is from the National Survey on Drug Use and Health (NSDUH) https://www.samhsa.gov/data/data-we-collect/nsduh-national-survey-drug-use-and-health						
P39	The website provides an online data analysis tool for researchers to perform simple one-way tables and two-way crosstabs on public use data files. For each variable, the tool provides a snapshot of the levels. Also, it provides a code book/documentation for a more detailed explanation on the variables and how it's collected/computed (the question asked in the original survey/whether something is imputed). Finally, typically, this type of dataset comes with a brief summary/report with the key findings and some figures/tables.	The platform provides online data analysis tool to perform simple one-way tables and two-way crosstabs. Snapshot of the levels for each variable. Documentation explaining the variables and how it's been collected (if imputation involved). Brief summary with key findings and some figures.					Online data analysis tool allows exploration. Documentation explaining the variables and its collection and handling methods. Brief summary with key findings. Relevant figures.
P39	Source reputation, Data collection conditions, Prevalence of missing data, Sample data						
P39	Yes						
P39	No						
P39	Didn't need to pay						
P39	Yes, most importantly because my expectation was low. The quality of the data is well-established, and it's widely-used in the literatures (so I guess this is some form of user review although I didn't select it in Q4). From the online tools and documentations, I had a pretty good idea about what the dataset contained.	Expectation was low. Quality is established and widely used in literatures. The provided online data analysis tools and documentations suggest what the dataset contained.					Widely used in literatures. Information suggest what the dataset contained. (From data analysis tools and documentations.)
P39	I'm not sure what "usable quality" is referring to in Q6, but I think this is harder because sometimes we ask more from a dataset if the goal is to use it in analysis. For example, for my purpose, missingness and data collection conditions are important but not necessary given that the average quality of data on this topic (methamphetamine use) is somewhat poor. However, if I were to incorporate this dataset in some models or formal reportable analysis, then missingness and collection do matter.	Need information on missingness and data collection conditions for modeling and formal analysis. Such information is less critical for the reported task due to the low expectations.			expectation on task performance linked to the expectations set for the data under certain topic;		Information on missingness and data collection conditions

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P39	I didn't need to pay, but if I were, I believe the decision would largely depend on funding and alternatives. If the dataset is reasonably priced and there is no close alternatives, then I would consider the following: Certainly, the data providers cannot publish the whole dataset, but I would assume that some sort of sample data along with documentations should be provided. User review is also important for me because I would like to know what other people are doing with this dataset (ideally like on Kaggle there are datasets and notebooks that conduct analyses on these datasets). Other measures including the data collection process and missingness are also important for determining the quality.	When to purchase: need to have enough funding, and verify it's of reasonable price as well as there's no close alternatives. What information needed to make the decision: sample data, documentaion, user reviews that contain concrete use cases, ideally with notebooks Consider data collection process and missingness indicate data quality					Information about sample data, documentaion, user reviews that contain concrete use cases, ideally with notebooks, data collection process and missingness
P39	I was trying to find some data to demo the application of experiment design methodologies in healthcare for my causal inference research group. I was doing this because I wasn't ready to use the real medical data gathered by our . I was able to get some online datasets. There wasn't a specific topic that I was looking for, which was probably why I failed, but I was looking for some structure in the dataset to support the analysis for doing experiment design.	Need data to demo the experiment design. Look for data with certain structures.		Demonstrate the application of experiment design methodologies in healthcare		Data with certain structures	
P39	Kaggle and some other online datasets platform						
P39	I look for data collection conditions, missing data, and sample size. I also look for definition of the variables to try to get the relationship between variables.	Need information on data collection conditions, missing data, and sample size. Need definitions of the columns to understand the relationships					Need information on data collection conditions, missing data, and sample size. Need definitions of the columns to understand the relationships
P39	Source reputation, User reviews, Data collection conditions, Prevalence of missing data						
P39	Yes						
P39	Not Sure						
P39	Didn't need to pay						
P39	For this project, I only got to know what I needed from the dataset after browsing through a couple of them. The criteria that I picked out from the list in Q4 are reflections of my initial search. I paid more attention to the structure of the dataset once I realized that's very important for my purpose.	While browsing through datasets: pay attention to source reputation, user reviews, data collection conditions, prevalence of missing data. When considering to use one: shift focus to the structure of the dataset			"I only got to know what I needed from the dataset after browsing through a couple of them."		Source reputation, user reviews, data collection conditions, prevalence of missing data, structure of the dataset
P39	I think it'll be even more difficult to know since sometimes I realized the dataset wasn't good enough after having done some analysis on it.	Difficult to know: may realize the dataset is not of good quality after some analysis					Perform some analysis on the data.
P39	Not sure, didn't need to pay, would be a similar thought process as the previous.	When to purchase: need to have enough funding, and verify it's of reasonable price as well as there's no close alternatives. What information needed to make the decision: sample data, documentaion, user reviews that contain concrete use cases, ideally with notebooks Consider data collection process and missingness indicate data quality					Need to have enough funding, and verify it's of reasonable price as well as there's no close alternatives. Information on sample data, documentaion, user reviews that contain concrete use cases, ideally with notebooks, data collection process, and missingness.

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P37	I'm an economics major MA student at <redacted organization>, frequently working with data for various research projects. I use data to analyze socioeconomic impacts and conduct empirical analysis. My research involves gathering and analyzing data from sources including government databases (e.g., U.S. Bureau of Labor Statistics) and academic databases (e.g., NBER.org, IPUMS.org, NORC at UChicago).	Economics major MA student working with data for research project: use data to analyze socioeconomic impacts and conduct empirical analysis. Gather and analyze data from government databases and academic databases					
P37	1 year						
P37	I am a student focused on economic research within the academic sector.						
P37	Monthly						
P37	I was studying the socioeconomic impact of a fare-free public transit program in Kansas City, MO, for my research thesis. I was looking for a dataset that ideally contains: 1. Information on whether the respondent resides in Kansas City during a specific time period; 2. information on the respondent's employment status, commuting method, and other demographic info (age, gender, race, income, education, etc.); and 3. The specific routes and geographic areas covered by the fare-free public transit program. Number 3 was difficult to achieve, so I primarily focused on obtaining a dataset that fulfilled criteria 1 and 2. The Current Population Survey (CPS) contained most of the information I needed. However, it did not include data on whether a respondent resides in Kansas City, MO, or the counties that constitute Kansas City, MO, due to confidentiality reasons. Therefore, I ended up compromising by using data on the state level (residents in Missouri).	Task: Study the socioeconomic impact of a fare-free public transit program in Kansas. Look for a dataset contains information on: 1. whether respondents reside in Kansas, 2. their employment status, commuting method, and other demographic information, 3. routes and status covered by the program. 3 is hard to met, so obtain a dataset with columns contain information on 1 and 2 but with less granularity.		Study the socioeconomic impact of fare-free public transit program in Kansas		A dataset contains information on: 1. whether respondents reside in Kansas, 2. their employment status, commuting method, and other demographic information, 3. routes and status covered by the program	
P37	IPUMS-CPS						
P37	The most important factor is whether the dataset contains the data I needed.	Need the dataset to contain required data.					Contain required columns
P37	Source reputation, Metadata, Data collection conditions, Prevalence of missing data, Ability to access full datasets, Sample data						
P37	Yes						
P37	Yes						
P37	No						
P37	Prevalence of missing data, ability to access full datasets, metadata, and sample data are most helpful in terms of helping me determine whether a dataset is suitable for my research. This information allows me to understand the completeness, accessibility, context, and structure of the data, ensuring it aligns with my research needs.	Need information on prevalence of missing data, ability to access full datasets, metadata, and sample data to understand the completeness, accessibility, context, and structure of the data, which ensures the data aligns with research needs.					Need information on prevalence of missing data, ability to access full datasets, metadata, and sample data
P37	The datasets I have been using mostly come from reputable government or academic databases, so data quality hasn't been a concern for me.	Data quality is not a concern because datasets come from reputable organizations.					Come from reputable data provider
P37	If I needed to pay to access the dataset, it is important to know how much I would have to pay to make a decision, considering my budget. Sample data is also a MUST-have because paid datasets are often not accessible for preview. I will need to at least have a glimpse of of the dataset to understand what data are available, the level at which data are they collected (individual vs. aggregate), and the level at which they are representative (county, state, etc.).	Need to know price and budget. Must have sample data: what data are available, whether it's collected at the individual or aggregate level, and its representativeness					Need to know price and budget. View sample data

PID	Responses	Open code	Role	Task	Notes	Dataset	Criteria
P37	In my research proposal on the impact of work-from-home on individual happiness, I was looking for a dataset that contained: 1. whether an individual engaged in remote or hybrid working during a certain time period; 2. the individual's rating of their happiness (e.g., very happy, quite happy, not happy), time spent or frequency for leisure activities, etc. Unfortunately, the most relevant dataset I found did not contain info on whether the individual worked remotely or not (and many other databases do not include this info, either). I ended up terminating that project due to the lack of necessary data.	Study impact of work-from-home on individual happiness. Look for a dataset contains information on: 1. whether individuals engage in remote or hybrid working, 2. rating on happiness, leisure activities' frequency. Unable to find any dataset contain information on whether individuals work remotely.		Study impact of work-from-home on individual happiness		Dataset contains information on: 1. whether individuals engage in remote or hybrid working, 2. rating on happiness, leisure activities' frequency. Unable to find any dataset contain information on whether individuals work remotely
