

Informal introduction (5 min) - Consent to record. Who we are/what we're doing. Chance to ask questions.

Co-design activity (20 min) - Ask participants to assemble UI elements for search and preference elicitation to find a valuable dataset in each scenario. Remind them to think about why these UI elements would be helpful in the given scenario and how they would use them in their workflow.

Interview (20 min) - Ask questions from the interview guide. Listen and take notes. Ask follow-up questions to clarify interesting things that participants mention related to our research questions. Be sure to touch on each topic, but feel free to move on quickly if the participant does not offer much information related to our research questions.

Introduction

We are researchers in <redacted institution>, we are interested to learn how people assess the value of data when seeking new datasets and the role that visualization plays in dataset discovery. We are interviewing you because we found your response to our earlier survey interesting

Co-design activity

In this study, we're interested to learn how you look for new datasets and decide they are worth-using.

1. When was the last time you searched for tabular data to reuse for a particular purpose? What tools or process did you use to go for the search piece? (Did you get what you were looking for?)
2. Now imagine that you have some datasets you are considering to work with, and you need to decide whether you want to move forward with using that dataset to accomplish your data-driven tasks, and you have access to a dedicated search tool. This image displays UI elements that are typically provided on today's sharing platform to help users assess the value of a dataset. In your ideal data search interface, which UI elements do you believe that might help to meet your information needs? Additionally, feel free to suggest any other UI elements that you think would be helpful but might be missing from this list.
3. Could you walk us through your workflow for searching and evaluating that imagined tabular data and explain how you would use the UI elements that you just selected?

Interview

Now, we want to ask you a few more general questions about similar experiences with dataset discovery and search.

1. Do you evaluate the potential value of a dataset before exploring the full dataset extensively? How do you approach this? Are there any specific techniques or tools you use? (Could you tell us more about this process?)
2. Is data quality part of your assessment, if so, could you provide some examples of data quality issues you've encountered while searching for a dataset?

3. Do you ever purchase datasets from data providers? How do you reason about what price is worth paying? **(Split the responses by those who have purchased and those who have not)**
4. In your experience, what visualizations are typically provided on data discovery and sharing platforms? Do you think these are helpful?
5. Do you use visualizations to assess whether a dataset is useful before you commit to use it? How do you use these tools? What visualizations do you find helpful?
